My research in a doodle

Talk's outline

Introduction

- Recap on *models, simulations & experiments* on particles in turbulence
- Interesting questions

New results

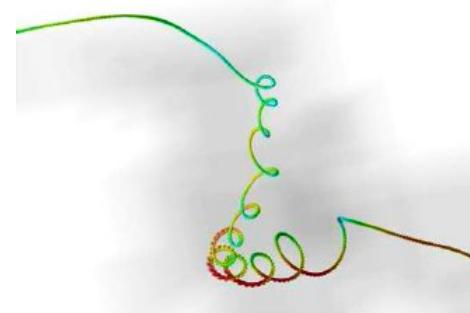

- Our numerical study on *large neutral (a)spherical* particles in turbulence
- Acceleration statistics
- Rotation statistics

Conclusions

A brief recap:

Models for the motion of a particle in a flow (1)

- Fluid tracers, or the Lagrangian point of view

$$\frac{d\mathbf{x}_f}{dt} = \mathbf{u}(\mathbf{x}_f(t), t) \quad \mathbf{a}_f \equiv \frac{D\mathbf{u}}{Dt} = -\frac{1}{\rho_f} \nabla p + \nu \Delta \mathbf{u} + \mathbf{f}$$

- Small inertial particles, an equation with many authors and many names

$$\frac{d\mathbf{x}_p}{dt} = \mathbf{v}(t)$$

$$m_p \frac{d\mathbf{v}}{dt} = 6\pi\mu r_p (\mathbf{u} - \mathbf{v}) + m_f \frac{D\mathbf{u}}{Dt} + \frac{m_f}{2} \frac{d(\mathbf{u} - \mathbf{v})}{dt} + 6r_p^2 \sqrt{\pi\rho_f\mu} \int_0^t \frac{d(\mathbf{u} - \mathbf{v})}{d\tau} \frac{d\tau}{\sqrt{t - \tau}} + (m_p - m_f)\mathbf{g}$$

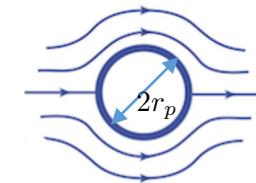

drag fluid acceleration added mass history buoyancy

Stokes (1851)

Boussinesq (1885), Basset (1888), Oseen (1927) -> BBO eq.

Tchen (1947), Corrsin-Lumley(1956)

Maxey-Riley (1983), Gatignol (1983) -> MRG eq. extension to non-uniform creeping flows

$$Re_p = \frac{\|\mathbf{u} - \mathbf{v}\|(2r_p)}{\nu} \ll 1$$
$$Re_s = \frac{\|\nabla \mathbf{u}\|(2r_p)^2}{\nu} \ll 1$$

A brief recap:

Models for the motion of a particle in a flow (2)

- Corrections to the point-particle equation

Finite-size effect (Faxén laws 1922)

$$\mathbf{u} \rightarrow [\mathbf{u}]_S \simeq \mathbf{u} + \frac{r_p^2}{6} \Delta \mathbf{u}$$

in drag , history

$$\mathbf{u} \rightarrow [\mathbf{u}]_V \simeq \mathbf{u} + \frac{r_p^2}{10} \Delta \mathbf{u}$$

in fluid acceleration , added mass

Finite-Reynolds effect (Shiller-Neumann 1935) wake drag empirical correlation

$$6\pi\mu r_p \rightarrow 6\pi\mu r_p(1 + 0.15Re_p^{0.687}) \quad Re_p \lesssim 10^3$$

Lift force for light particles (Auton JFM 1987, inviscid calculation)

$$\mathbf{f}_{lift} = \frac{m_f}{2} (\mathbf{u} - \mathbf{v}) \times (\nabla \times \mathbf{u})$$

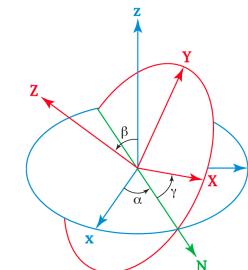

- If particles are even larger: rigid body equations

$$m_p \frac{d\mathbf{v}}{dt} = \mathbf{F}$$

$$\frac{d\boldsymbol{\Omega}}{dt} = \mathbf{T}$$

$$\mathbf{F} = \oint_{S_p} \boldsymbol{\sigma} \cdot \mathbf{n} \, dS$$

$$\mathbf{T} = \oint_{S_p} (\mathbf{x} - \mathbf{r}) \times (\boldsymbol{\sigma} \cdot \mathbf{n}) \, dS$$

A brief recap:

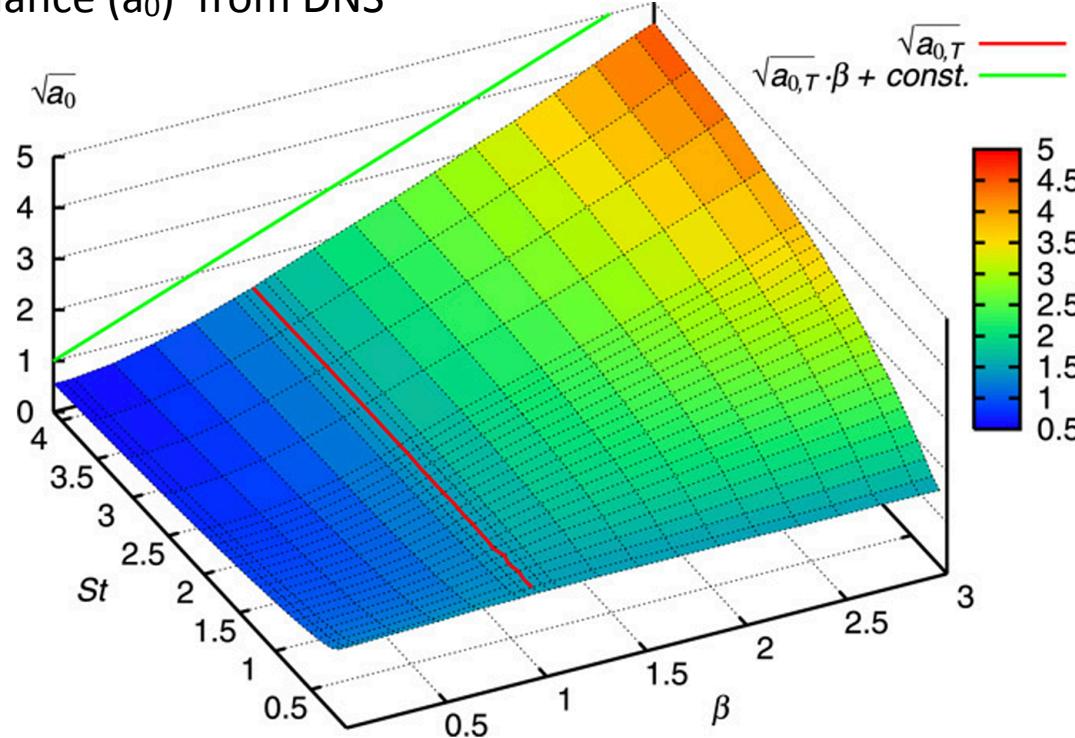

Acceleration statistics in numerics and experiments (1)

- Point-particle model & experiments

Volk, EC, Verhille, Lohse, Mordant, Pinton, Toschi, Physica D (2008)

$$\frac{d\mathbf{v}}{dt} = \beta \frac{D\mathbf{u}}{Dt} + \frac{1}{\tau_p}(\mathbf{u} - \mathbf{v}) \quad \beta = 3\rho_f/(\rho_f + 2\rho_p) \\ \tau_p = r_p^2/(3\nu\beta)$$

Acceleration
variance (a_0) from DNS

A brief recap: Acceleration statistics in numerics and experiments (1)

- Point-particle model & experiments

tracer
 $d = 1.8 \eta$

neutral
 $d=15 \eta$

Variance (a_0)

Experiment

	$St = \frac{\tau_p}{\tau_\eta}$	a_0
Tracers	0.24	6.4 ± 1
Neutral	16	2.2 ± 1
Heavy	0.58	4.3 ± 1
Bubble	1.85	26 ± 5

Numerics

	$St = \frac{\tau_p}{\tau_\eta}$	a_0
Tracers	0.31	2.85 ± 0.07
Neutral	4.1	2.94 ± 0.07
Heavy	1.03	2.63 ± 0.12
Bubble	1.64	25.9 ± 0.46

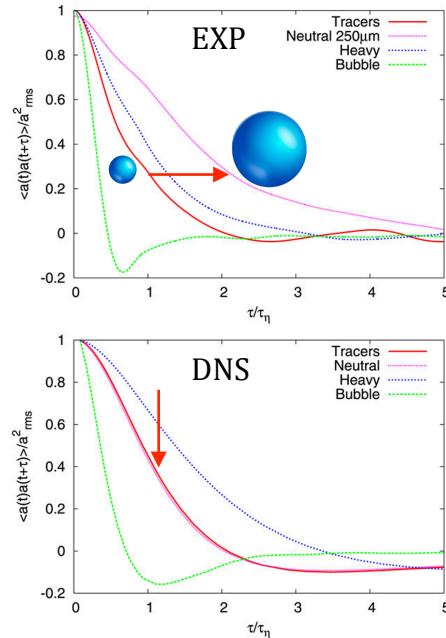

$$\frac{d\mathbf{v}}{dt} = \beta \frac{D\mathbf{u}}{Dt} + \frac{1}{\tau_p}(\mathbf{u} - \mathbf{v})$$

$$\beta = 3\rho_f/(\rho_f + 2\rho_p)$$

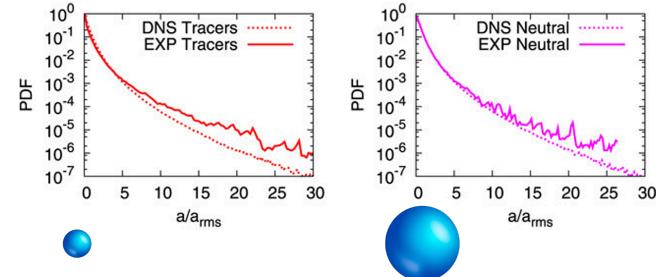

$$\tau_p = r_p^2/(3\nu\beta)$$

Volk, EC, Verhille, Lohse, Mordant, Pinton, Toschi, Physica D (2008)

Temporal correlation

Probability density function

A brief recap: Acceleration statistics in numerics and experiments (2)

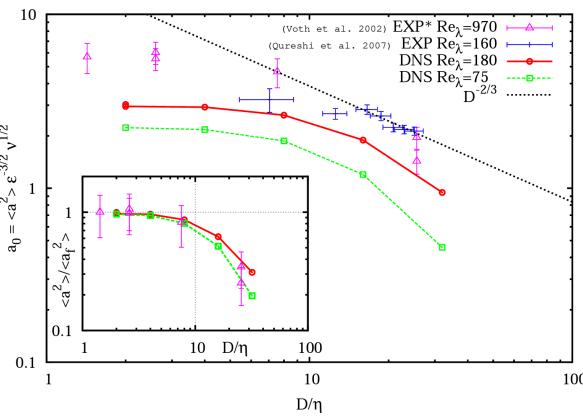

EC, Volk, Bourgoin, Leveque, Pinton, Toschi, JFM (2009)

- Faxén-finite-size model & experiments

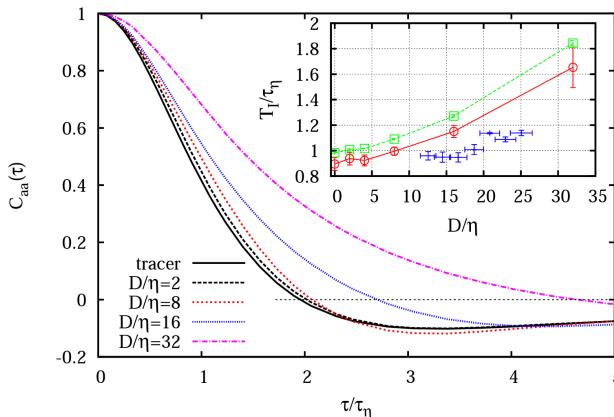

$$\frac{d\mathbf{v}}{dt} = \beta \left[\frac{D\mathbf{u}}{Dt} \right]_V + \frac{1}{\tau_p} ([\mathbf{u}]_S - \mathbf{v})$$

$$\left[\frac{D\mathbf{u}}{Dt}(\mathbf{x}, t) \right]_V \simeq \int_{L^3} G(\mathbf{x}') \frac{D\mathbf{u}}{Dt}(\mathbf{x} - \mathbf{x}', t) d^3x'$$

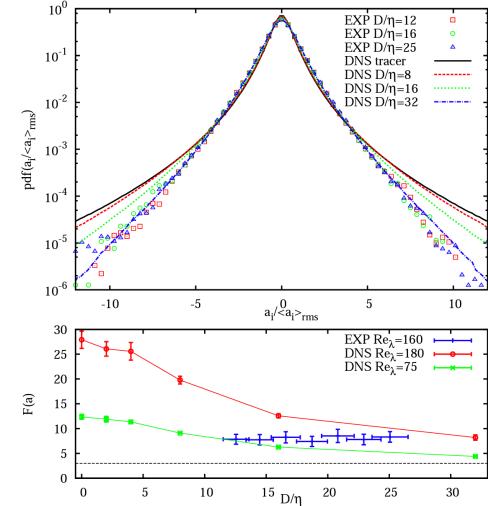

Variance

Temporal correlation

PDF and flatness

The coarse grained turbulence hypothesis (CGH)

$$a(D) \sim \frac{\delta_D p}{D} \sim \frac{(\delta_D u)^2}{D}$$

$$\tau_a(D) \sim \frac{D}{\delta_D u} \sim D^{2/3}$$

$$\mathcal{F}_a(D) = \frac{\langle a(D)^4 \rangle}{\langle a(D)^2 \rangle^2} \sim D^{\zeta_8 - 2\zeta_4 < 0}_{(-0.42)}$$

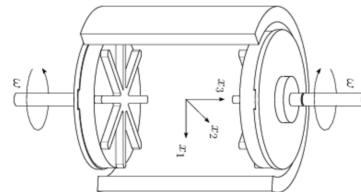

K41 $\delta_\ell u \sim \ell^{1/3}$

$$\tau_u(\ell) \sim \frac{\ell}{\delta_\ell u} \sim \ell^{2/3}$$

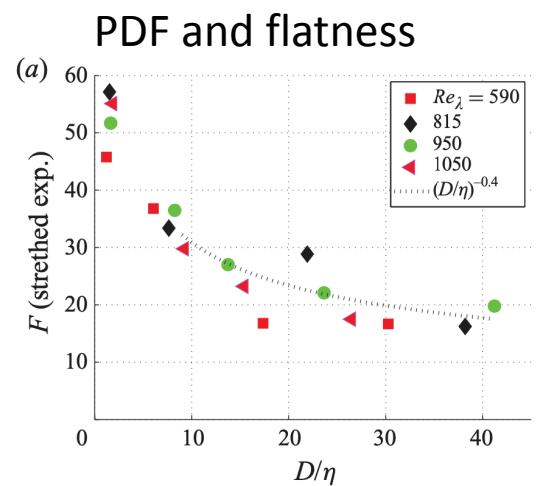

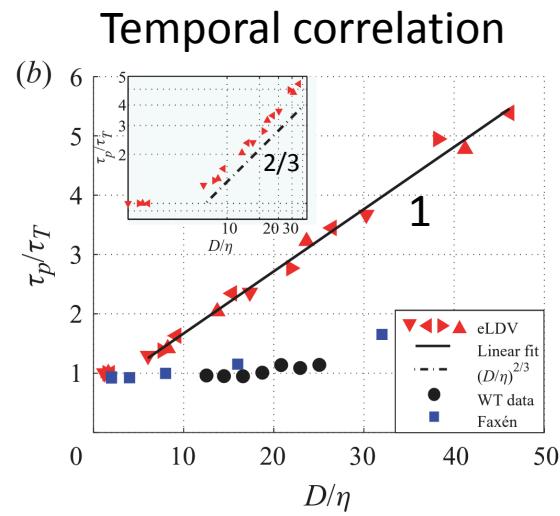

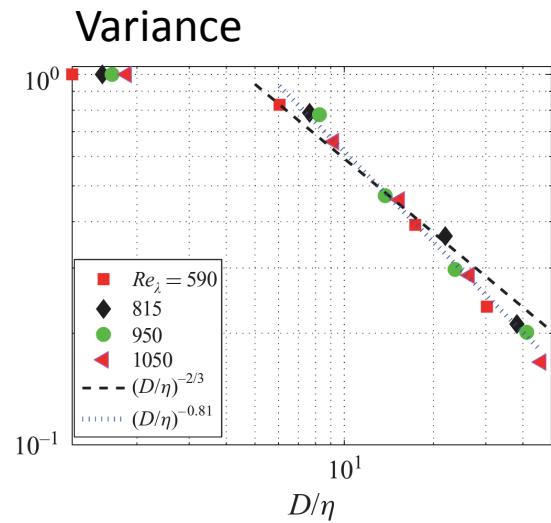

$$\langle (\delta_\ell u)^p \rangle \sim \ell^{\zeta_p}$$

A brief recap: Acceleration statistics in numerics and experiments (3)

- Von Karman flow experiments (large Re)

Volk, EC, Leveque, Pinton JFM (2011)

$$\langle a(D)^2 \rangle \sim D^{-0.81}$$

$$\tau_a(D) \sim D$$

$$\mathcal{F}_a(D) \sim D^{-0.4(-0.6)}$$

CGH: $\langle a(D)^2 \rangle \sim D^{-2/3}$

$$\tau_a \sim D^{2/3}$$

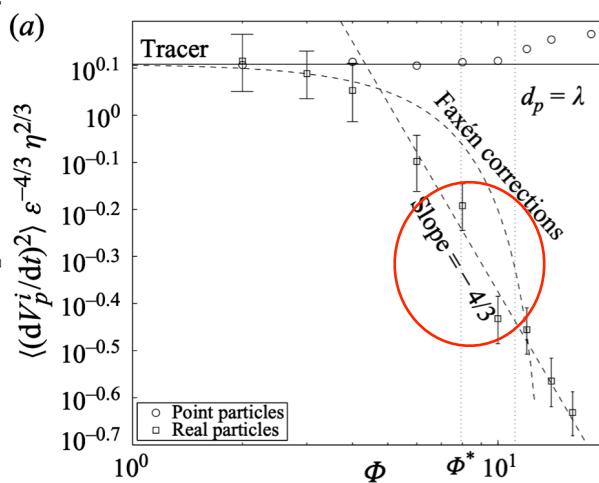

$$F_a(D) \sim D^{-0.42}$$

A brief recap: Acceleration statistics in numerics and experiments (4)

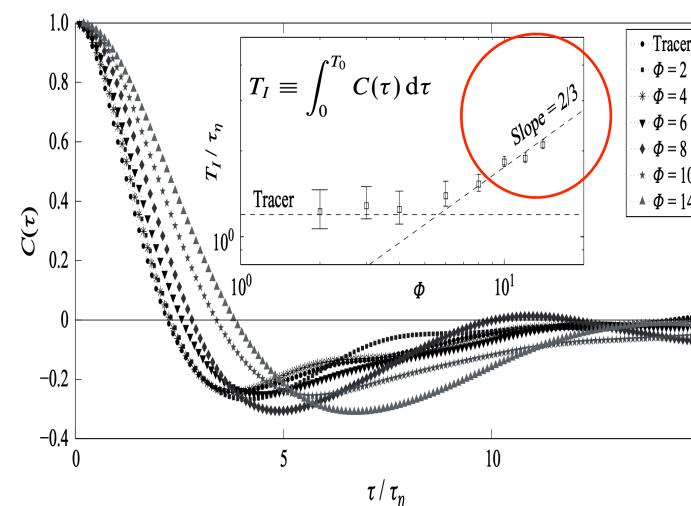

- Fully resolved simulations (low Re) $Re_\lambda = 32$

[Homann & Bec JFM \(2010\)](#)

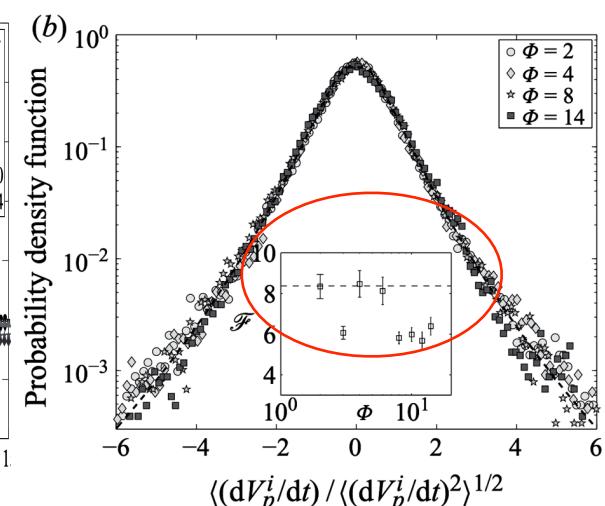

Variance

Temporal correlation

PDF and flatness

$$\langle a(D)^2 \rangle \sim D^{-4/3}$$

$$\tau_a(D) \sim D^{2/3}$$

$$\mathcal{F}_a(D) \sim const.$$

$$CGH: \quad \langle a(D)^2 \rangle \sim D^{-2/3}$$

$$\tau_a \sim D^{2/3}$$

$$F_a(D) \sim D^{-0.42}$$

[Cisse, Homann & Bec JFM \(2013\)](#) -> slipping motion and particle boundary layer

[Uhlmann & Chouippe JFM \(2017\)](#) -> particle preferential concentration

Interesting questions

- Do **finite-sized particles** experience coarse-grained turbulent flow **accelerations**?

$$a(D) \sim \frac{\delta_D p}{D} \sim \frac{(\delta_D u)^2}{D} \sim D^{-1/3} \quad \tau_a(D) \sim \frac{D}{\delta_D u} \sim D^{2/3} \quad \mathcal{F}_a(D) \sim D^{\zeta_8 - 2\zeta_4}$$

or does particle-flow coupling create specific statistical signatures?

- How is the particle finite-size reflected on particle **rotations**?

$$\Omega(D) \sim \frac{1}{\tau(D)} \sim \frac{\delta_D u}{D} \sim D^{-2/3} \quad (\text{CGH})$$

- What is the effect of **shape anisotropy** on finite-sized particles?

Small anisotropic particles align with flow structures: For large particles is a randomization of rotations to be expected?

- What do we learn of turbulence when we look at a moving particle?

Chao Sun (孙超) & Linfeng Jiang (蒋林峰)
Tsinghua University, Beijing, China

A new numerical study

Navier-Stokes equations (NSE)

$$\partial_t \mathbf{u} + \mathbf{u} \cdot \nabla \mathbf{u} = -\rho^{-1} \nabla p + \nu \nabla^2 \mathbf{u} + \mathbf{f},$$

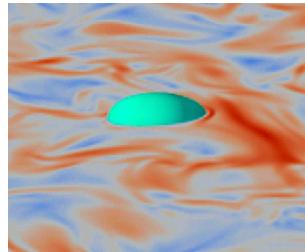

$$\nabla \cdot \mathbf{u} = 0,$$

+ Newton-Euler equations (NEE)

$$m_p \frac{d\mathbf{v}}{dt} = \mathbf{F} \quad \mathbf{F} = \oint_{S_p} \boldsymbol{\sigma} \cdot \mathbf{n} \, dS \quad \boldsymbol{\sigma} = -p\mathbf{I} + \rho\nu(\nabla \mathbf{u} + \nabla \mathbf{u}^T)$$
$$\frac{d\mathbf{I}\boldsymbol{\Omega}}{dt} = \mathbf{T} \quad \mathbf{T} = \oint_{S_p} (\mathbf{x} - \mathbf{r}) \times (\boldsymbol{\sigma} \cdot \mathbf{n}) \, dS$$

+ no-slip boundary conditions @fluid-particle interface

Code:

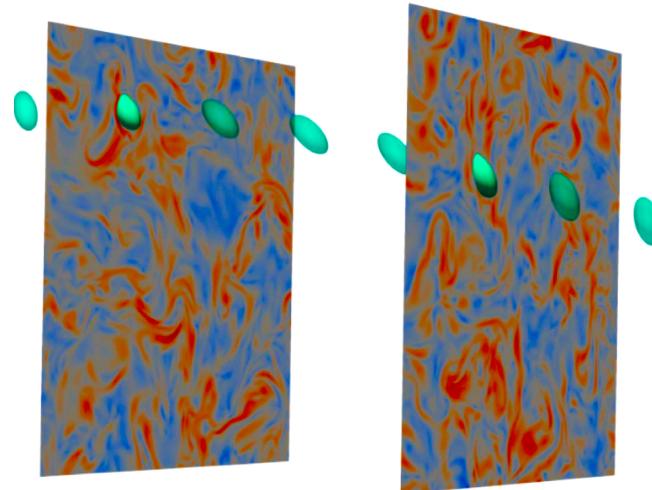

<https://github.com/ecalzavarini/ch4-project>

Methods:

- Lattice Boltzmann (fluid)
- Quaternions (rigid body)
- Immersed boundaries (interface)

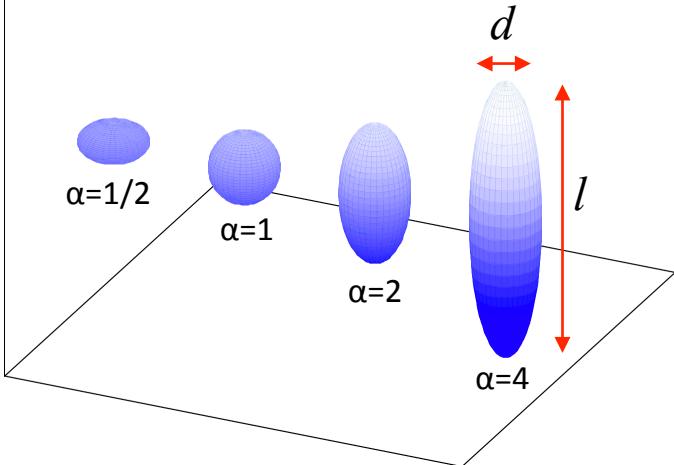

Same methods as

K. Suzuki, T. Inamuro, Comput. & Fluids 49, 173-187 (2011)

Parameter space

axisymmetric spheroids

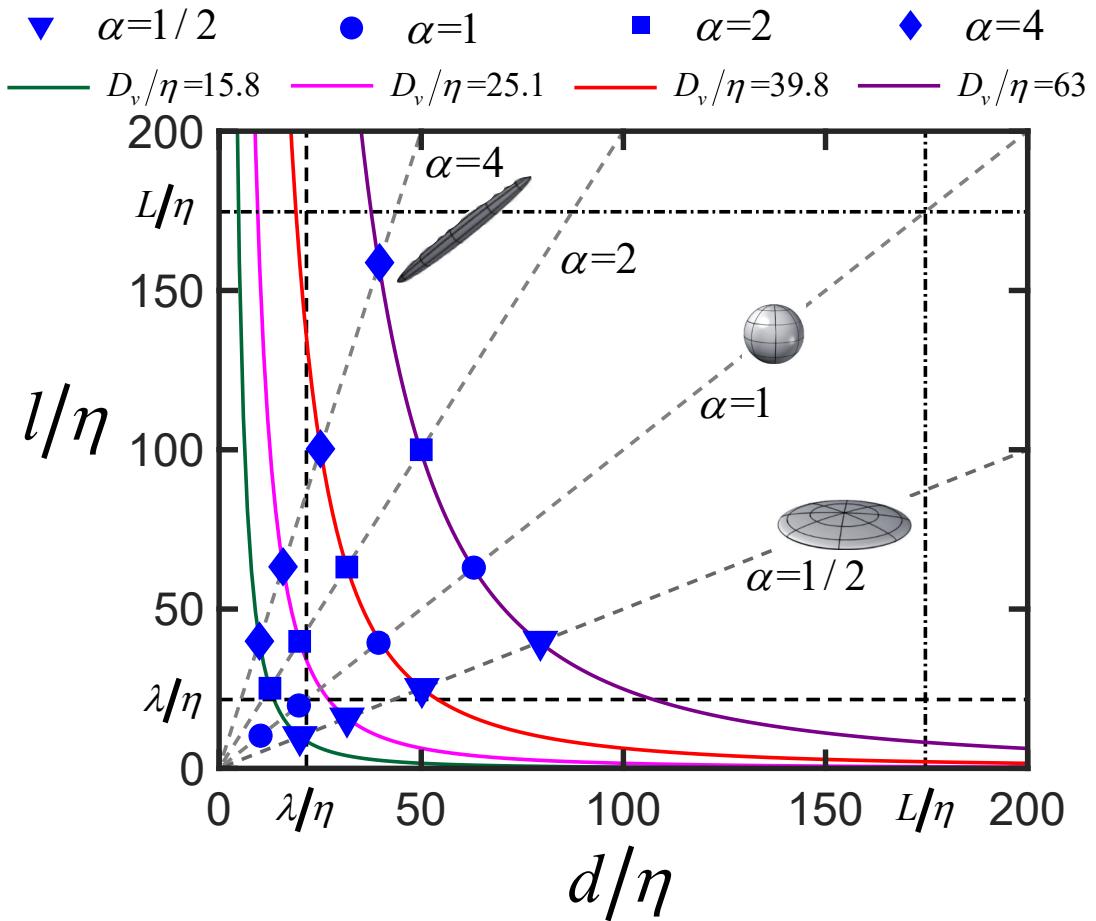

aspect ratio

$$\alpha = \frac{l}{d}$$

Volume equivalent diameter

$$D_v = (d^2 l)^{1/3} = d\alpha^{1/3}$$

$$Re_\lambda = 120$$

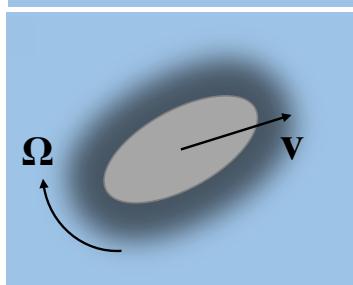

Auxiliary particle models

$$\mathbf{F} = \oint_{S_p} \boldsymbol{\sigma} \cdot \mathbf{n} \, dS$$

$$\mathbf{T} = \oint_{S_p} (\mathbf{x} - \mathbf{r}) \times (\boldsymbol{\sigma} \cdot \mathbf{n}) \, dS$$

Real Particles (RP)

Numerical Experiments

- NSE + EE
- NSE + tracer eq. + Jeffery eq.

Spheres: acceleration at low Re

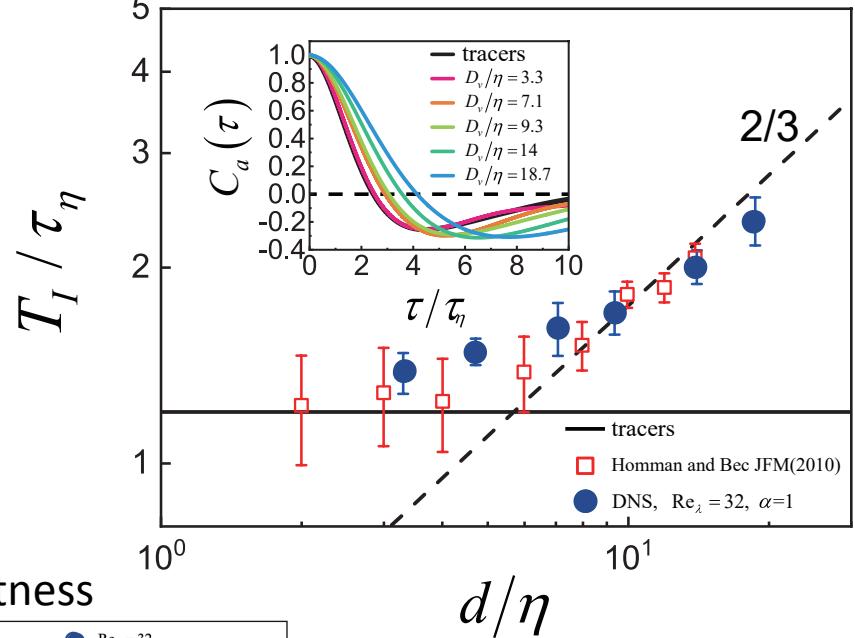

Comparison with Homann & Bec JFM 2010

$Re_\lambda = 32$

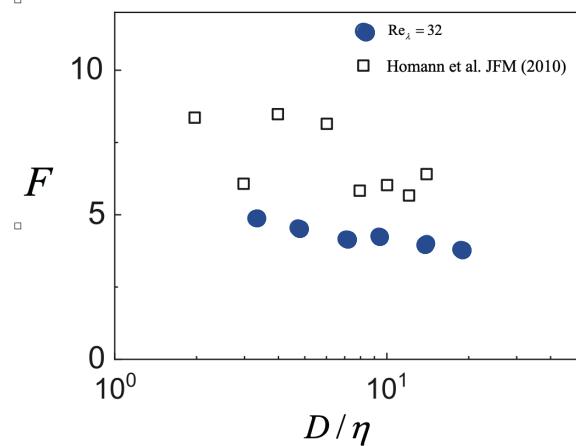

Variance

Correlation time

Flatness

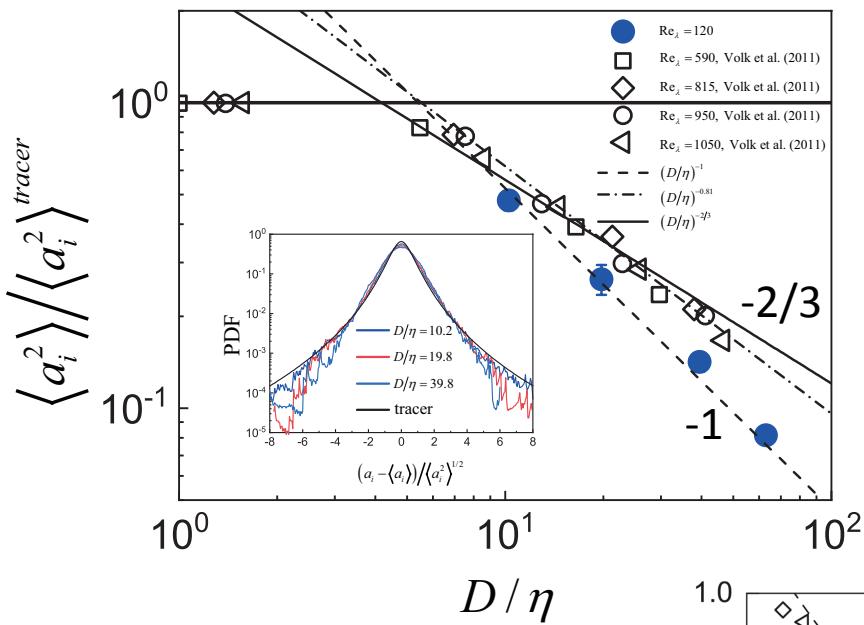

Spheres: acceleration at larger Re

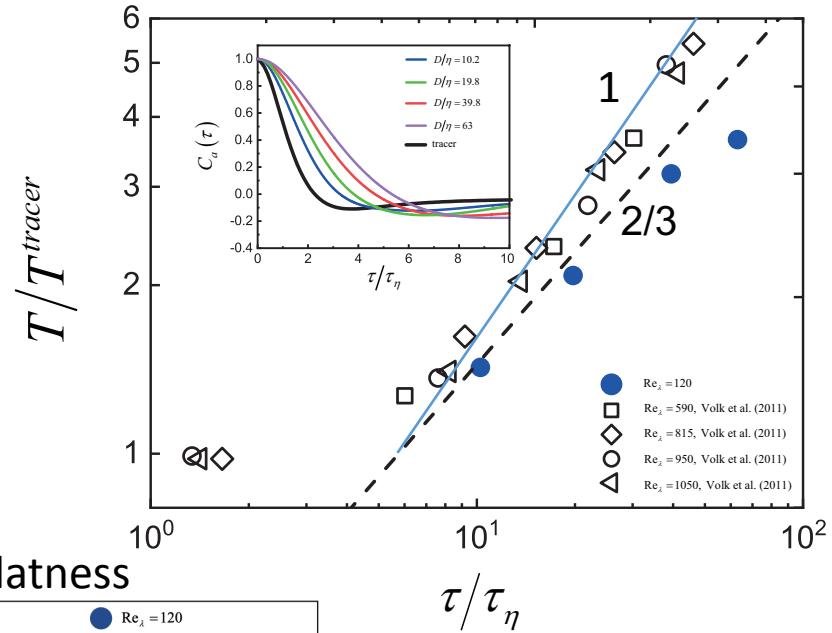

Comparison with Volk et al. JFM 2011

$Re_\lambda = 120$

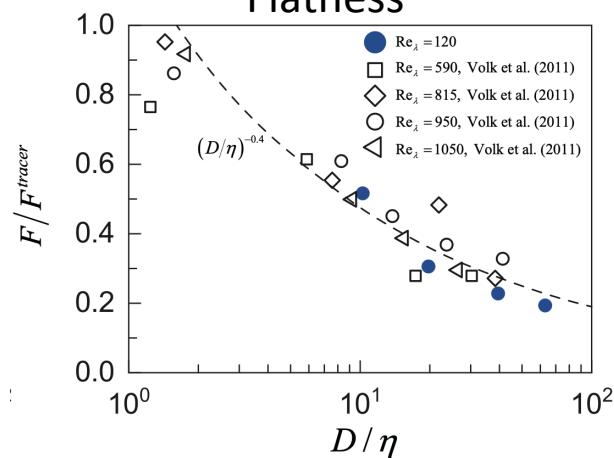

Variance

Correlation time

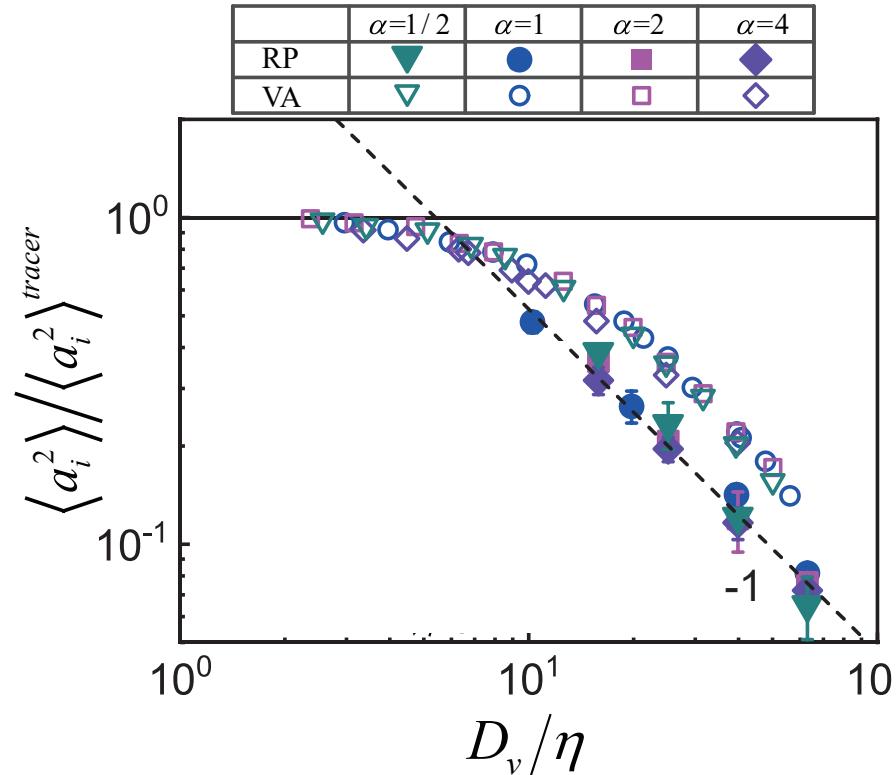

Flatness

Spheroids: Acceleration variance

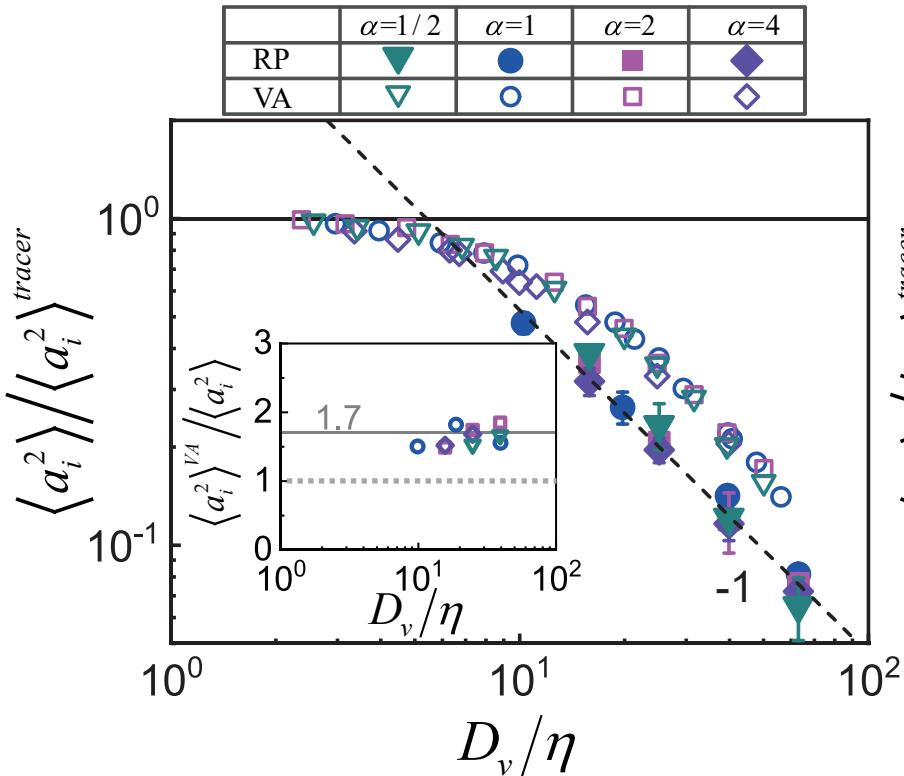

Real Particles vs Volume Averages

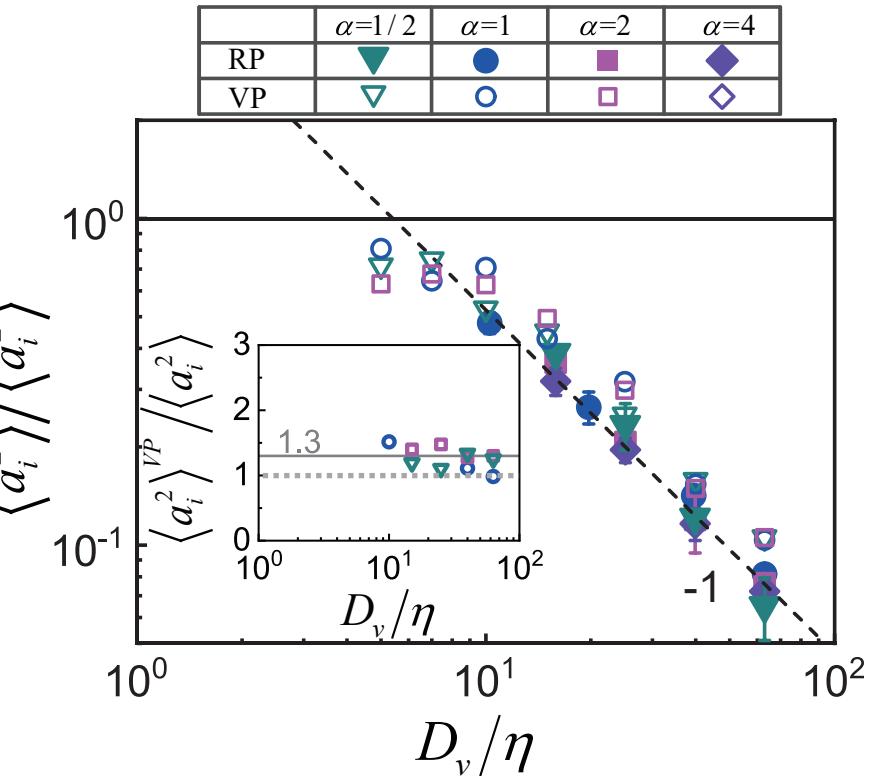

Same trend in D_v with an offset

Spheroids: Acceleration variance

Real Particles vs Volume Averages

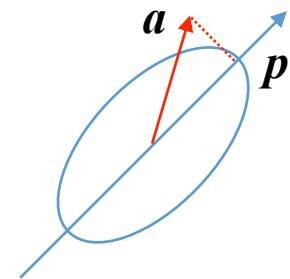

Real Particles vs Virtual Particles

Better overlap for VP particles

$$D_v = (d^2 l)^{1/3} = d\alpha^{1/3}$$

Spheroids: Acceleration alignment

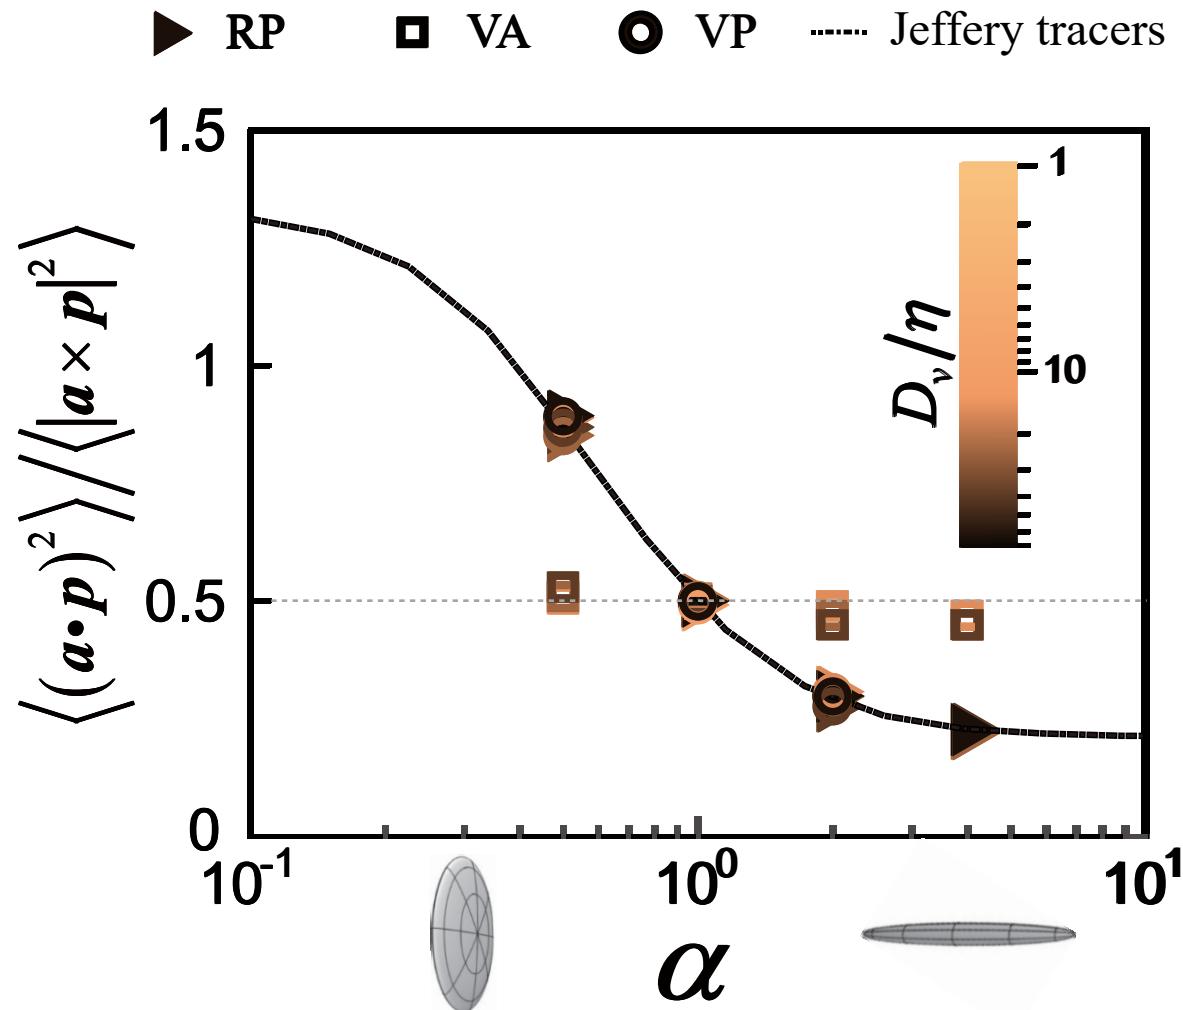

Axial acceleration

$$a^{\parallel} = (a \cdot p)p$$

Transverse acc

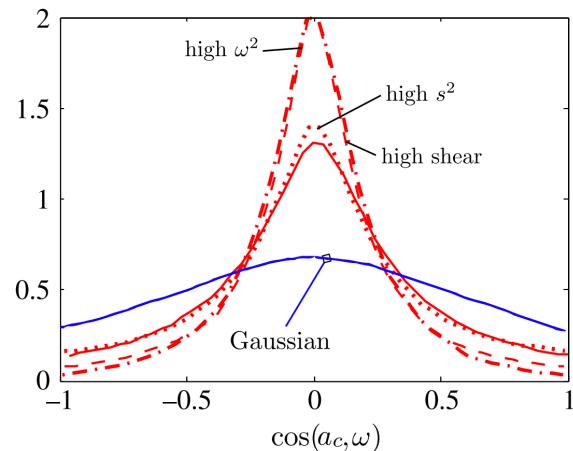

$$a^{\perp} = a \times p$$

Spheroids: Acceleration alignment

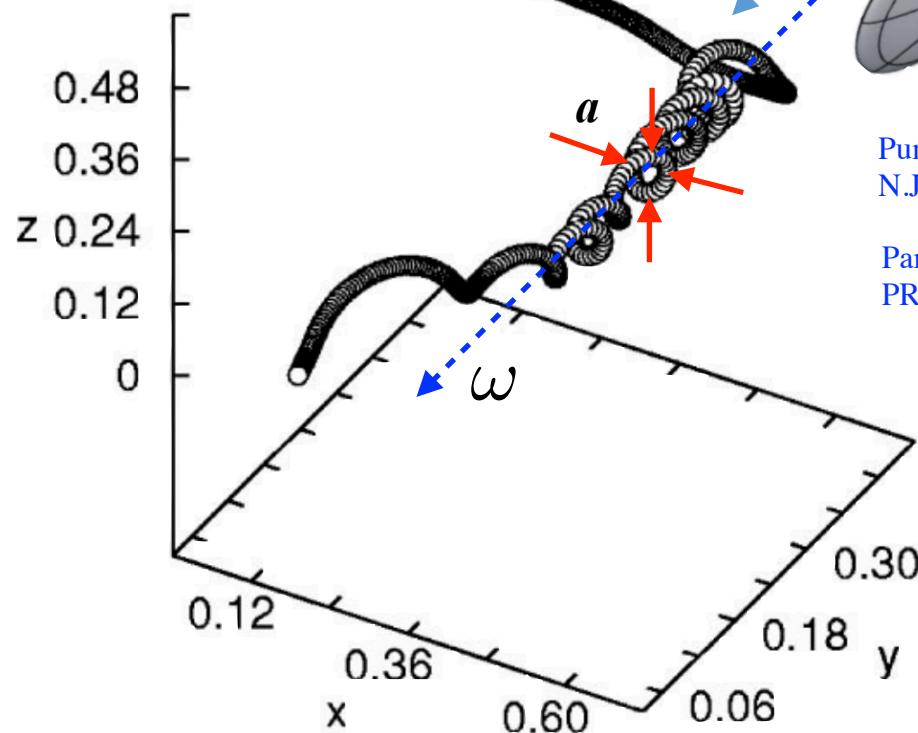

A qualitative explanation

EXP: $\mathbf{a} \perp \boldsymbol{\omega}$

A.Liberzon et al. Physics (2012)

DNS : vortex
filaments

Pumir & Wilkinson
N.J.Phys (2011)

Parsa et al.
PRL (2012)

Summary

Acceleration

Size-dependence explained by **fluid acceleration volume averages** (VA or VP)

Amplitude better accounted for **dynamical (Lagrangian) volume averages** (VP)

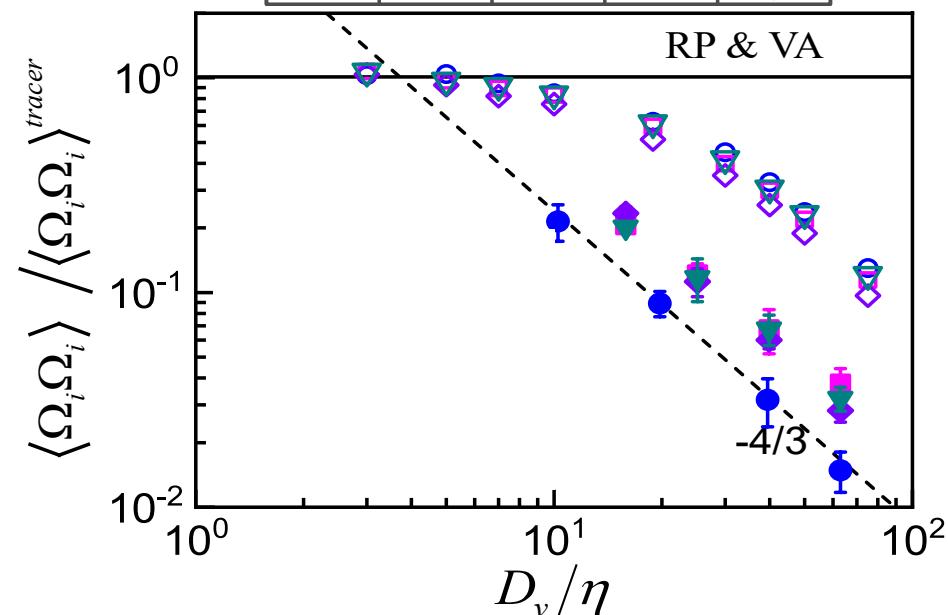

Importance of **flow structures**: preferential alignment even for inertial-scale particles!

Rotation

Spheroids: Angular velocity

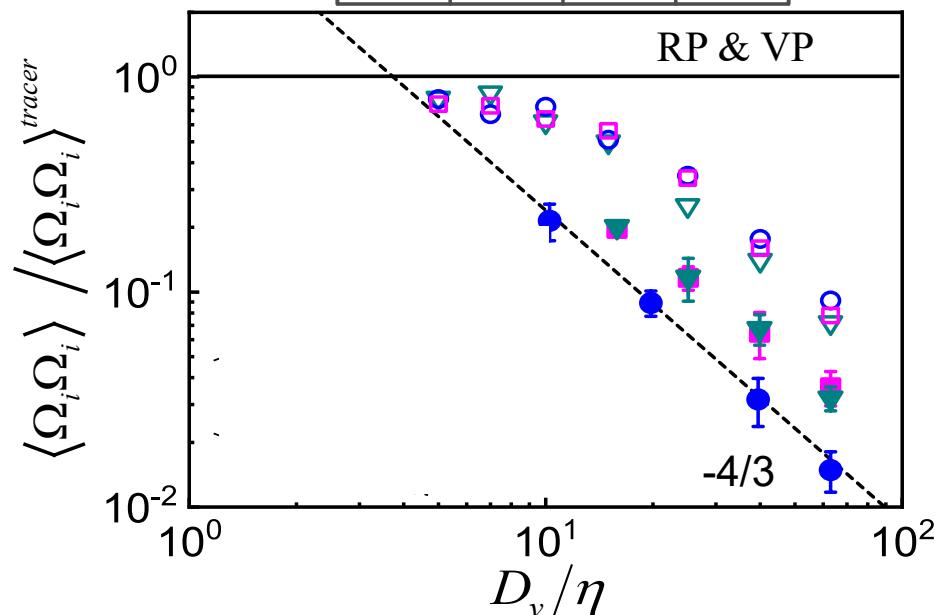

Real Particles vs Volume Averages

	$\alpha=1/2$	$\alpha=1$	$\alpha=2$	$\alpha=4$
RP	▼	●	■	◆
VA	▽	○	□	◇

Real Particles vs Virtual Particles

	$\alpha=1/2$	$\alpha=1$	$\alpha=2$
RP	▼	●	■
VP	▽	○	□

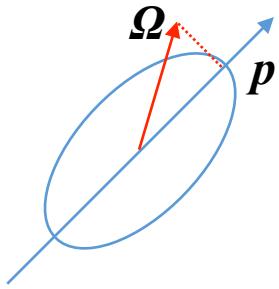

$$\Omega(D) \sim \frac{1}{\tau(D)} \sim \frac{\delta_D u}{D} \sim D^{-2/3}$$

Coarse grained scaling relation ok!

But no overlap of RP with VA or VP

Spheroids: spinning and tumbling

Two predictions:

1) Randomly oriented model in HIT flow

Parsa, EC, Voth, Toschi, PRL 2012

$$\langle \Omega_i^s \Omega_i^s \rangle = \frac{1}{12} \frac{1}{\tau_\eta^2}$$

$$\frac{\langle \Omega_i^s \Omega_i^s \rangle}{\langle \dot{p}_i \dot{p}_i \rangle} = \frac{\frac{1}{12} \langle \omega^2 \rangle}{\frac{1}{6} \langle \omega^2 \rangle + \frac{1}{5} \Lambda^2 \langle \mathcal{S} : \mathcal{S} \rangle} = \frac{5}{10 + 6\Lambda^2}$$

Axial rotation rate
(spin)

$$\Omega^s = (\boldsymbol{\Omega} \cdot \mathbf{p}) \mathbf{p}$$

$$\langle \dot{p}_i \dot{p}_i \rangle = \left(\frac{1}{6} + \frac{1}{10} \Lambda^2 \right) \frac{1}{\tau_\eta^2}$$

$$\Lambda = \frac{\alpha^2 - 1}{\alpha^2 + 1}$$

Transverse rotation
(tumbling)

$$\dot{\mathbf{p}} = \boldsymbol{\Omega} \times \mathbf{p}$$

2) CGH prediction

Oehmke et al., PRF 2021

$$\langle \Omega_i^s \Omega_i^s \rangle \sim d^{-4/3}$$

$$\frac{\langle \Omega_i^s \Omega_i^s \rangle}{\langle \dot{p}_i \dot{p}_i \rangle} \sim \frac{\alpha^{4/3}}{2}$$

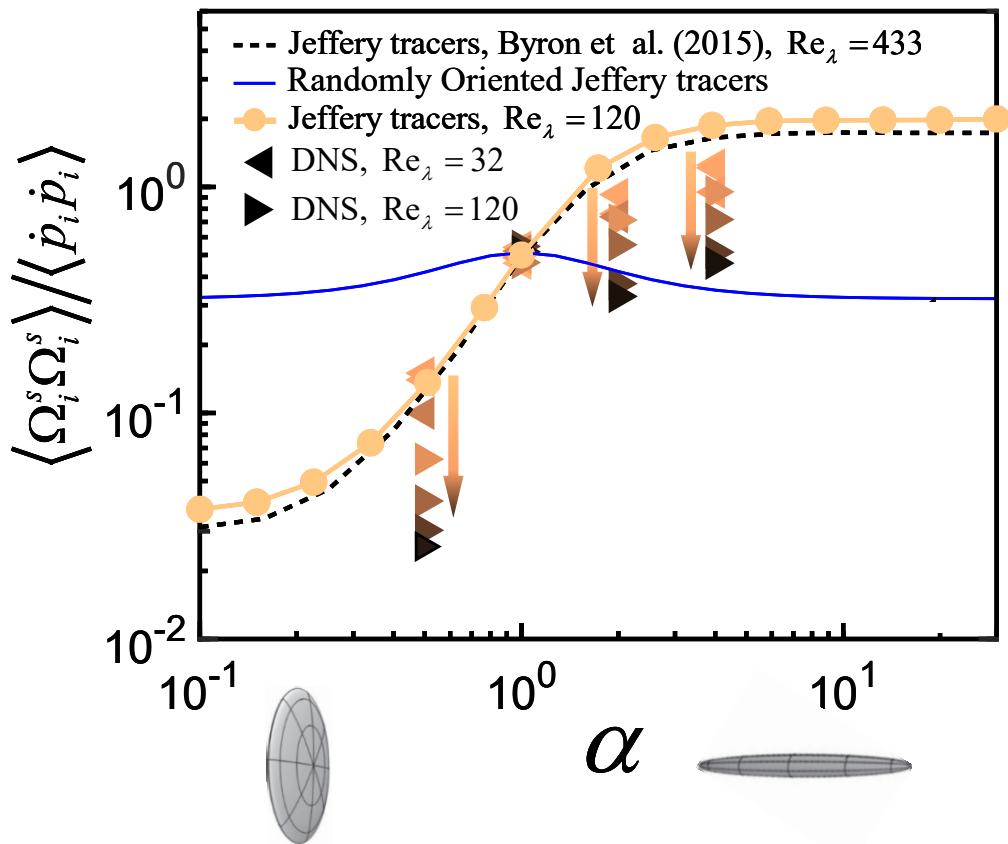

$$\langle \dot{p}_i \dot{p}_i \rangle \sim l^{-4/3}$$

Always no size
dependence!

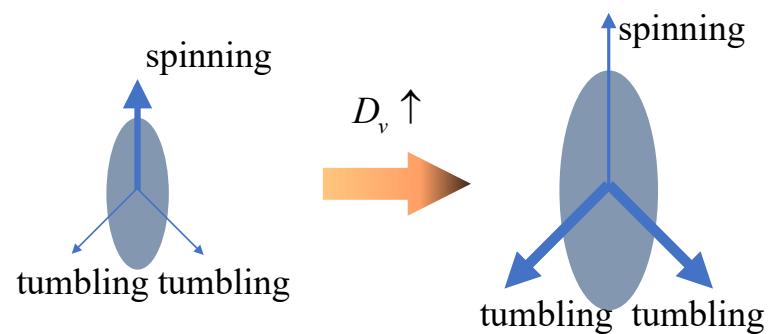

Review:

Voth & Soldati, Ann Rev Fluid Mech 2017

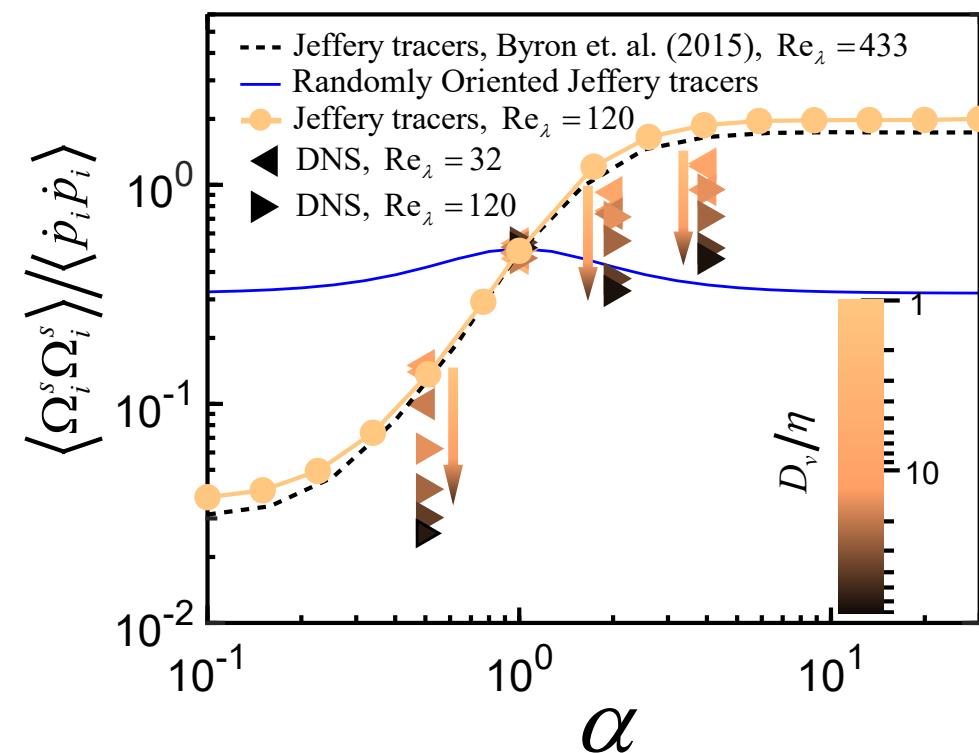

Spinning - tumbling variance ratio

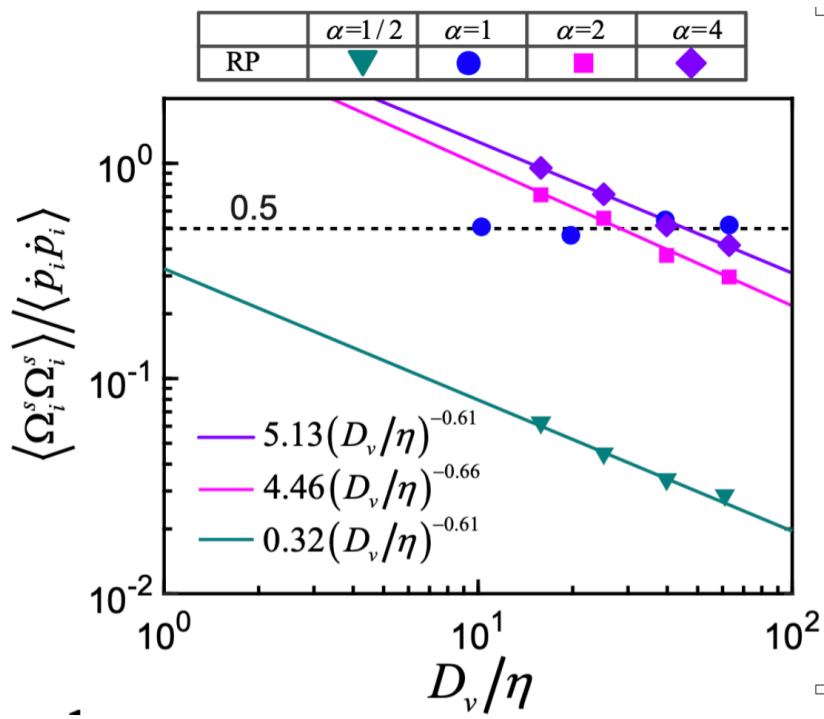

Large particles
spin less and tumble more

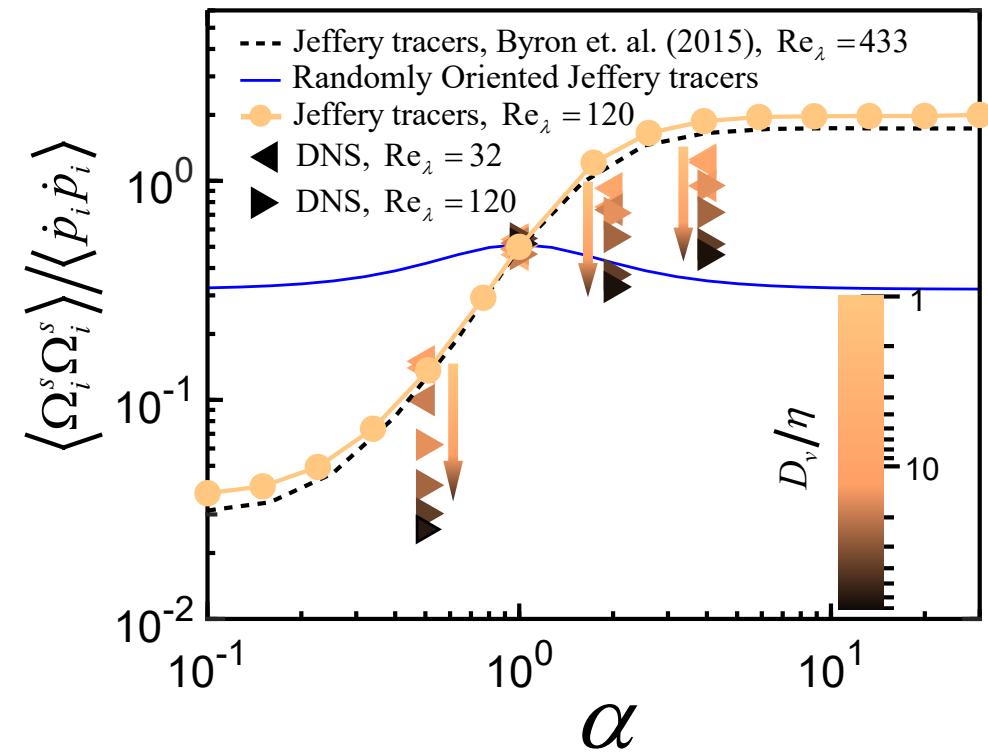

Spinning - tumbling variance ratio

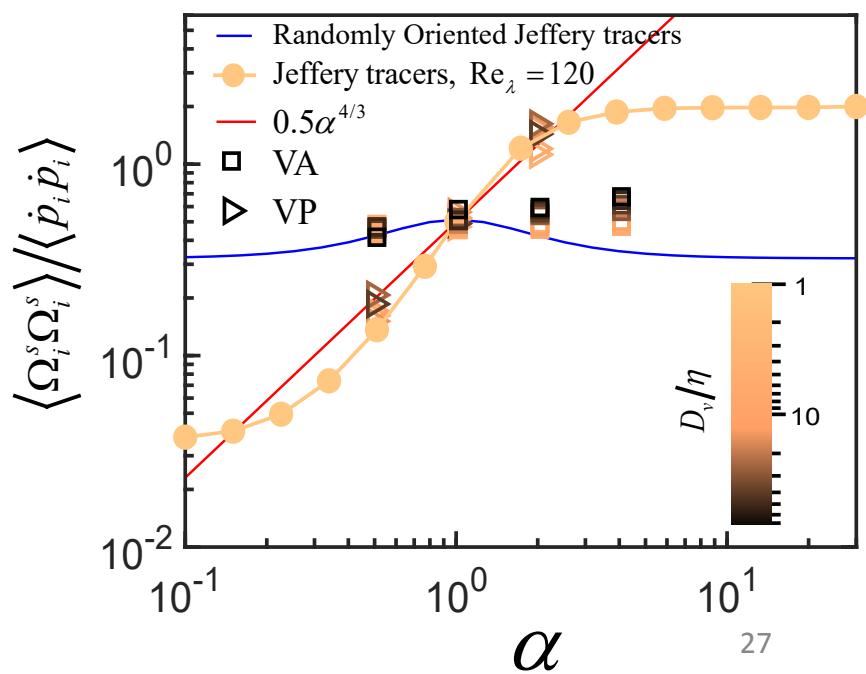

$$\frac{\langle \Omega_i^s \Omega_i^s \rangle}{\langle \dot{p}_i \dot{p}_i \rangle} \sim D_v^{-0.6}$$

Spinning - tumbling variance ratio

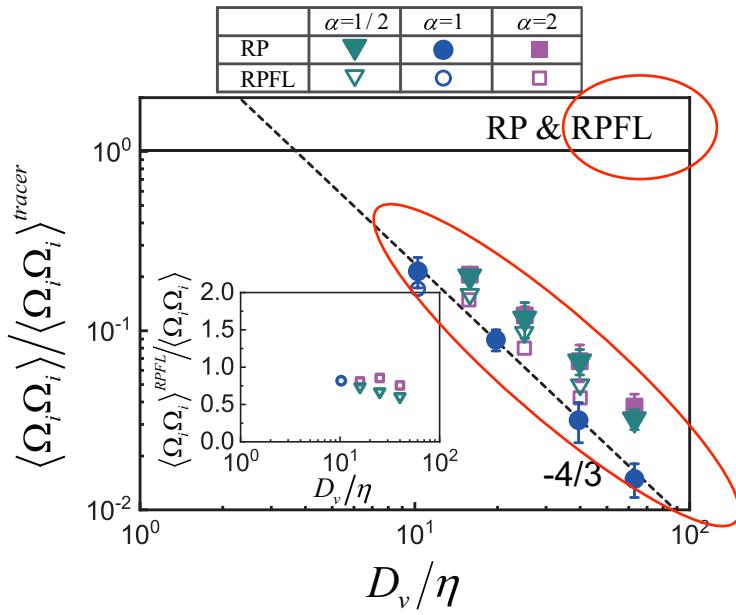

VA and VP do not explain the trends

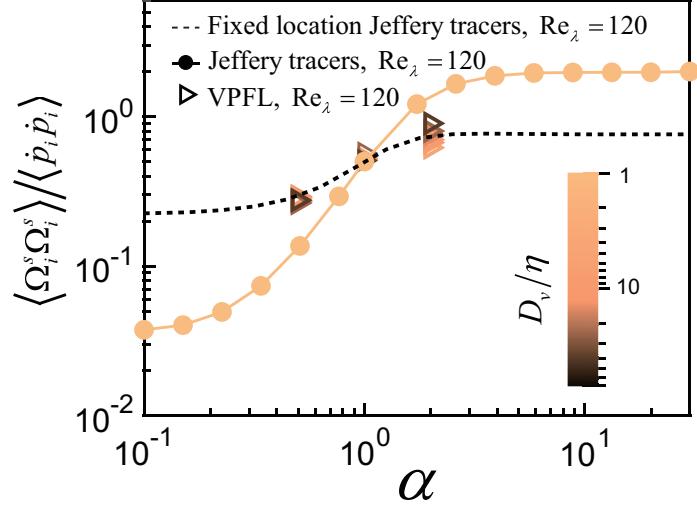

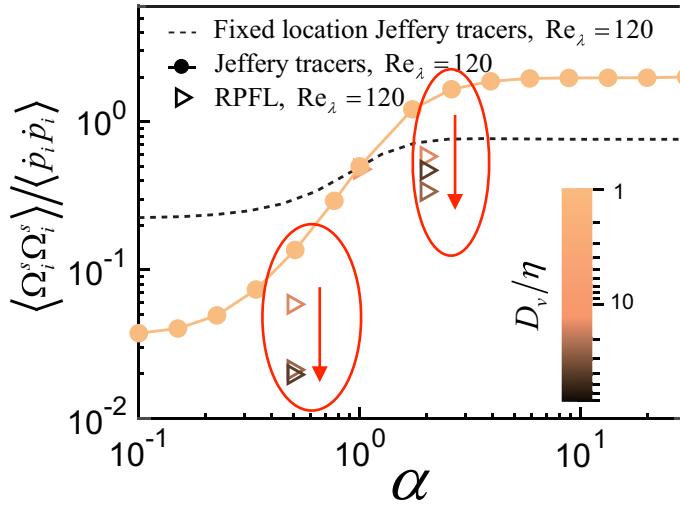

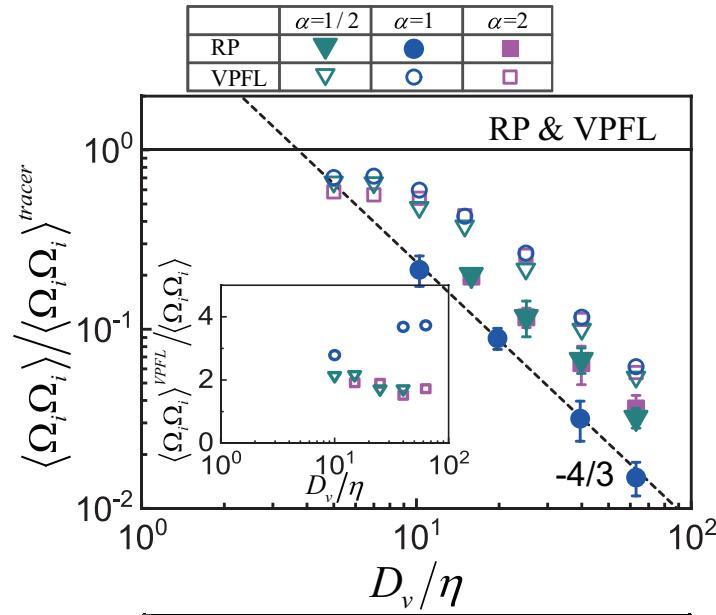

Spinning - tumbling variance ratio

Real Particles Fixed Location

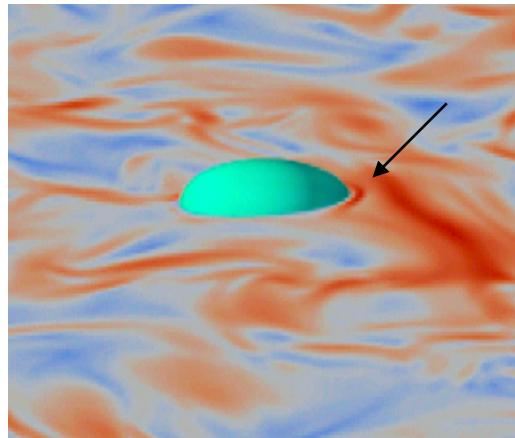

Virtual Particles Fixed Location

Spinning - tumbling variance ratio

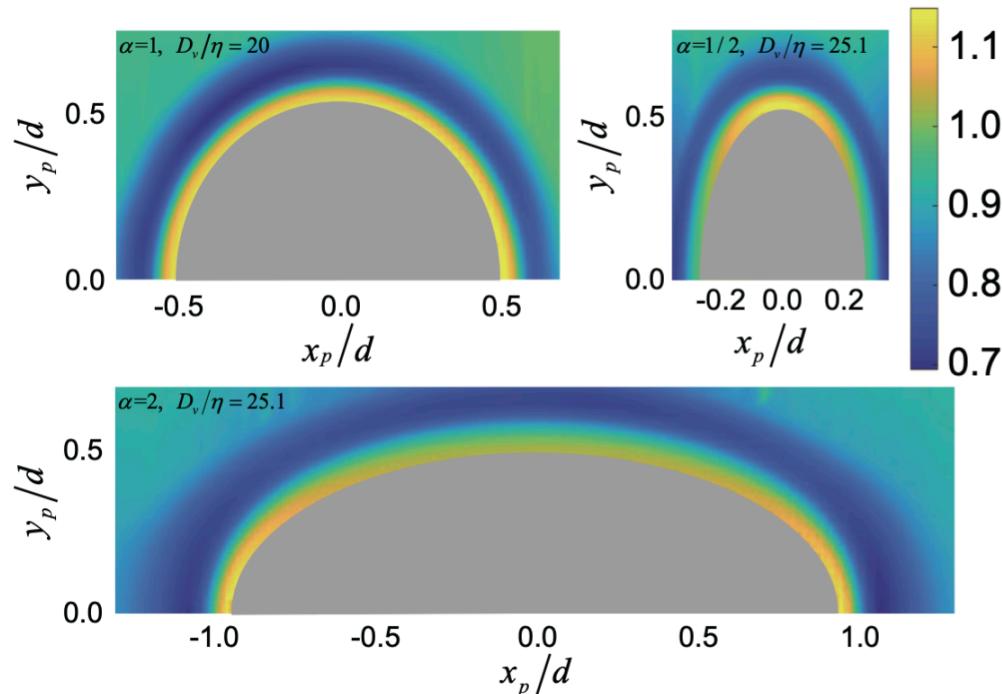

A boundary layer effect?

$$Re_p = \frac{|\mathbf{u} - \mathbf{v}| D_v}{\nu} \simeq \frac{D_v}{\lambda} Re_\lambda \sim O(10^2)$$

Dissipation field surrounding
a fully resolved particle

$$\frac{1}{4} \overline{\omega^2} / \overline{S : S}$$

Overall increase in strain-rate as compared to
vorticity \rightarrow this promote tumbling

Summary / conclusion

Acceleration

Size-dependence explained by **fluid acceleration volume averages** (VA or VP)

Amplitude better accounted for by **dynamical (Lagrangian) volume averages** (VP)

Importance of **flow structures**: preferential alignment even for inertial-scale particles!

Rotation

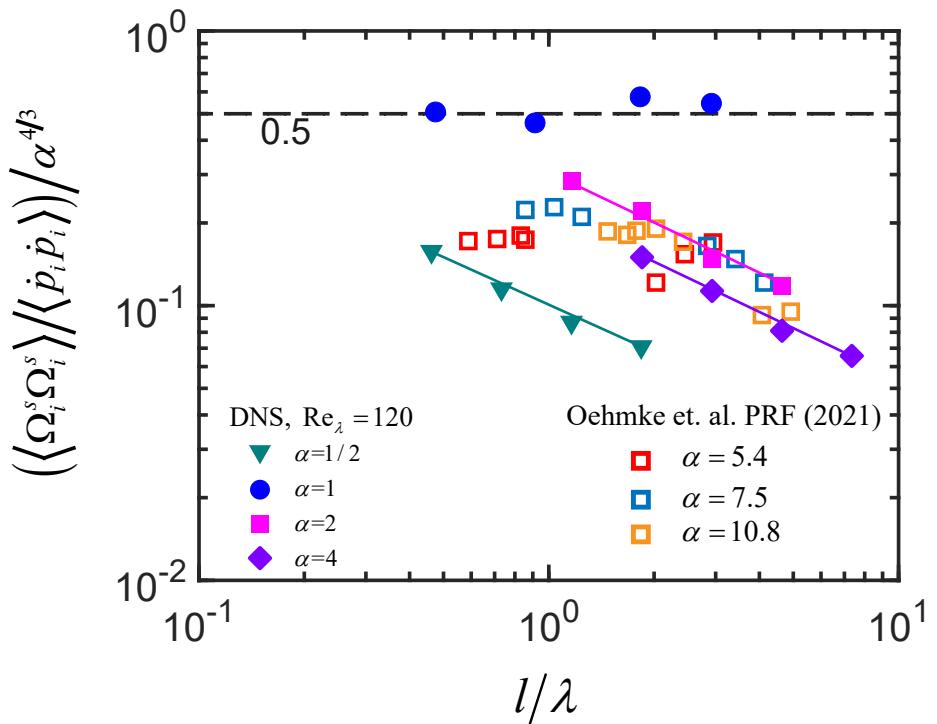

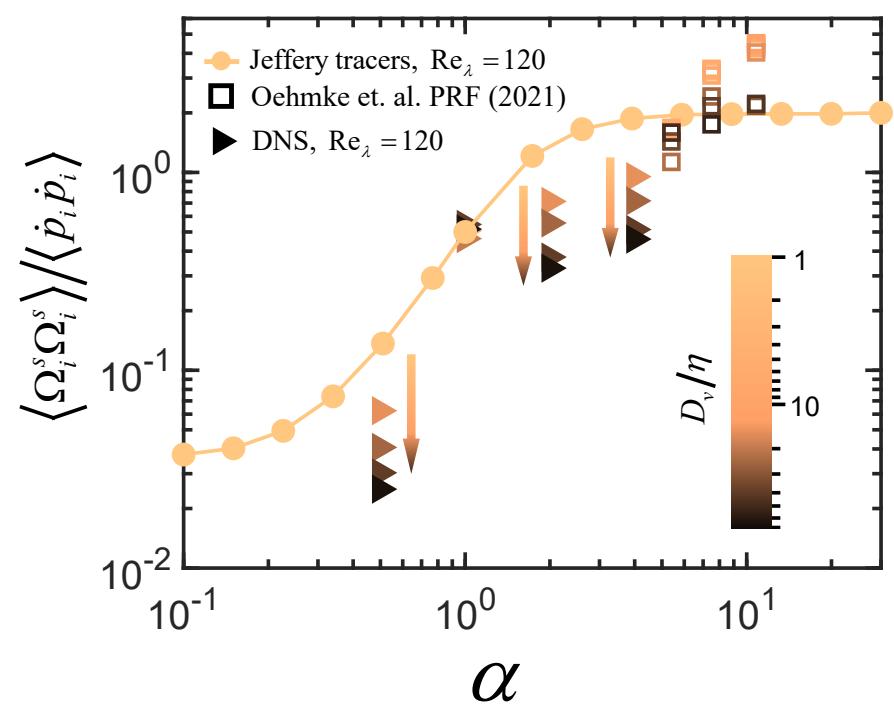

Size-dependence explained in terms of volume averages but not its **amplitude**

Importance of **two-way coupling** and **boundary layers**: decrease of spinning vs. tumbling!

Experimental verifications and high-resolution DNS are still (very much) needed!

Spinning - tumbling variance ratio

Comparison with Oehmke, Bordoloi, Variano, Verhille PRF (2021)

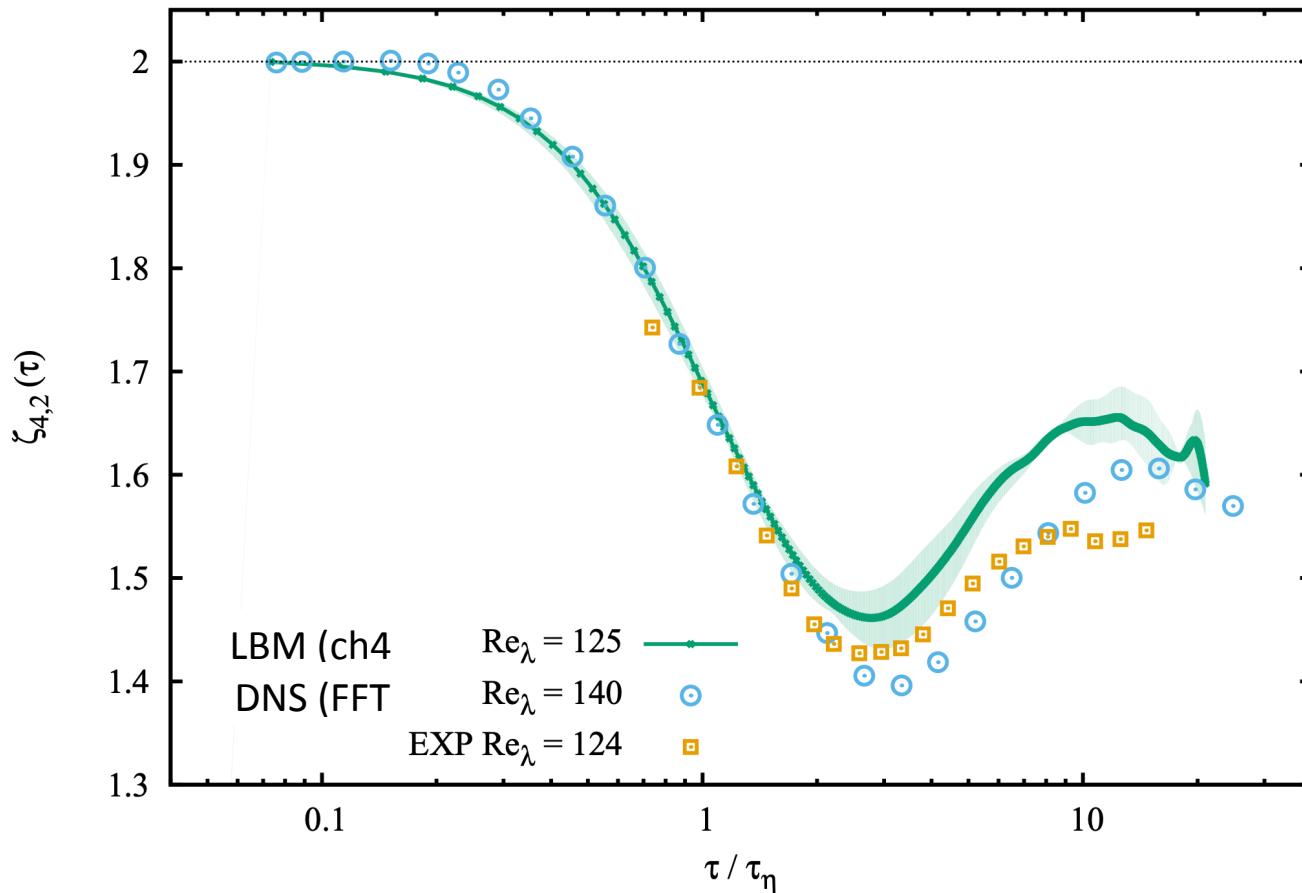

More experimental measures of tumbling & spinning needed.

Perspectives

- How to reach a more quantitative understanding? Modelling needed.
- Numerical results must be extended to higher Re numbers and to non-neutrally buoyant particles

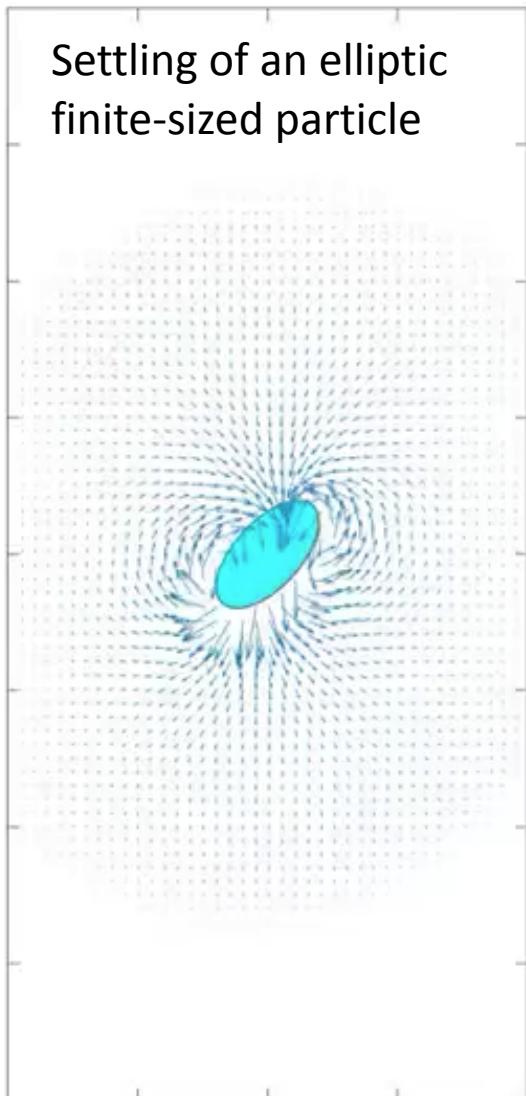

Code validation: Lagrangian tracer statistics

Calz....PRF (2021)

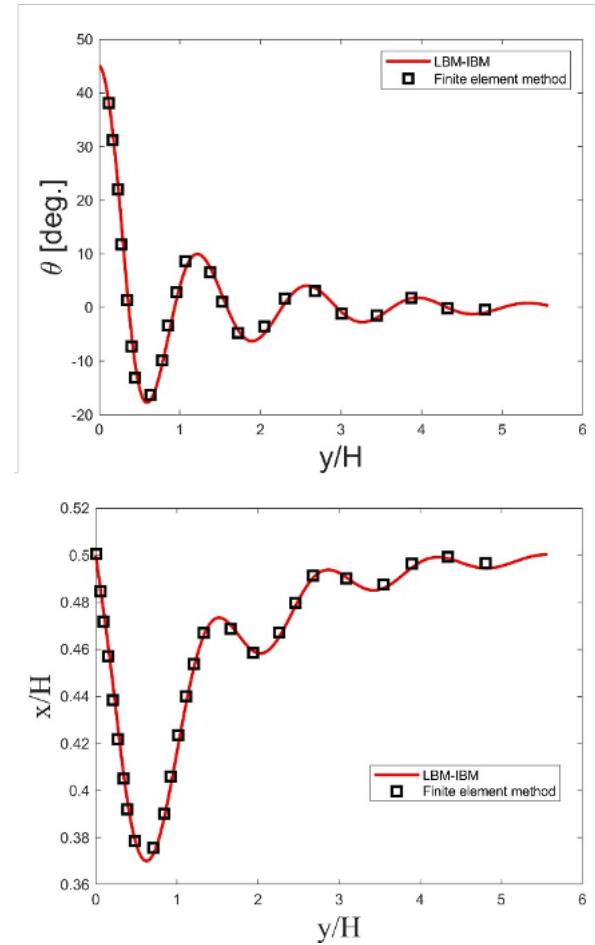

$$\zeta_{4,2}(\tau) = \frac{d \log \langle (\delta_\tau \dot{x}_{s,i})^4 \rangle}{d \log \langle (\delta_\tau \dot{x}_{s,i})^2 \rangle},$$

Code validation: particle sedimentation
